

Dashboard Design

Date	20 September 2026
Team ID	
Project Name	Food Consumer Behaviour Analytics Portal
Maximum Marks	5 Marks

Creating an effective dashboard involves thoughtful design to ensure that the presented information is clear, relevant, and easily understandable for the intended audience. Here are some key principles and best practices for dashboard design:

Activity 1: Interactive and visually appealing dashboards

Creating interactive and visually appealing dashboards involves a combination of thoughtful design, effective use of visual elements, and the incorporation of interactive features. Here is how each design point was explicitly implemented in the **Food Consumer Behavior Analysis** dashboard:

1. Clear and Intuitive Layout:

- **Implementation:** Organised in a structured **3x3 visual grid** topped by an executive KPI block. High-level summary metrics sit at the top left, followed by geographic distribution, price-tier breakdowns, cuisine demand, and operational feedback across standard visual tiers.

2. Use Appropriate Visualizations:

- **Implementation:** Selected specialized chart types tailored to each data dimension: **Lollipop/Bar charts** for city rankings, **Treemaps** for cuisine and revenue proportions, **Grouped Bar charts** for multi-variable age-tier comparisons, **Packed Bubbles** for feedback ratings, and a **Geographic Map** for spatial density.

3. Colour and Theming:

- **Implementation:** Applied a cohesive, professional palette using muted slate blues, teal, and soft sage mint tones. Color gradients are used purposefully to represent volume tiers and categorical groupings without creating visual noise.

4. Interactive Filters and Slicers:

- **Implementation:** Integrated global action filters across age groups, city locations, and cuisine types. Selecting any individual element (e.g., clicking "Mumbai" or "Desserts") dynamically filters all adjacent dashboard charts in real time.

5. **Drill-Down Capabilities:**

- **Implementation:** Enabled hierarchical exploration from high-level national metrics down to specific dining contexts (e.g., analyzing meal type ordering behaviors specifically when dining with "Family" vs. "Alone").

6. **Responsive Design:**

- **Implementation:** Configured container padding, auto-resizing canvas frames, and flexible grid elements to ensure smooth rendering across desktop web displays and embedded Flask web application viewports.

7. **Custom Visuals and Icons:**

- **Implementation:** Integrated custom packed bubble nodes for meal ratings, spatial pie-overlay markers on the geographical map, and styled KPI card blocks.

8. **Use of Infographics:**

- **Implementation:** Designed clean, bold KPI stat blocks at the top left to instantly convey core business numbers (Total Orders, Total Revenue, Delivery Fees, Avg Rating) before users dive into granular analytical charts.

Major Outcomes:

- **Customer Count & Revenue Overview:** The portal processed **50,000 total orders** generating **₹27.39M in Total Revenue** and **₹2.98M in Delivery Fees**, maintaining a platform-wide **Average Rating of 3**.
- **Highest Order Volume City:** **Mumbai leads all cities with 8,443 orders**, closely followed by Pune (8,354), Bangalore (8,353), Delhi (8,309), Chandigarh (8,279), and Hyderabad (8,262), showing highly uniform demand across major urban centers.
- **Peak Revenue Meal Slot:** **Breakfast accounts for the highest revenue segment at ₹6.92M**, with Lunch (₹6.86M), Snacks (₹6.86M), and Dinner (₹6.75M) generating nearly equal revenue shares across the day.
- **Demographic & Spend Segment Leader:** The **25–35 age cohort drives maximum order volume**, demonstrating highest engagement in the **Premium restaurant category (6,983 orders)**.
- **Dominant Cuisine Preferences:** **Desserts lead overall item demand at 16.9% (8,452 orders)**, followed by Chinese (16.7%), Fast Food (16.7%), Biryani (16.6%), and South Indian (16.6%).
